

TASK 27

1. Ansible :

[Ansible](#) is an open-source IT automation engine that simplifies tasks like configuration management, [application deployment](#), and provisioning using simple, declarative YAML code, working agentlessly over SSH or WinRM to manage servers and infrastructure efficiently, making complex IT processes repeatable and less error-prone.

- **Configuration Management:** Ensures servers and devices are consistently configured.
- **Application Deployment:** Automates the process of deploying apps.
- **Orchestration:** Coordinates complex workflows across multiple systems.
- [Cloud Provisioning](#): Sets up cloud resources.
- **Agentless:** Doesn't require special software (agents) on managed nodes, just SSH/WinRM.
- [YAML-based](#): Uses human-readable YAML for "playbooks" (instructions).
- **Idempotent:** Running a playbook multiple times results in the same state without unwanted changes.

2. ad hoc command :

An **Ansible ad hoc command** is a single-line command executed from the command line of the Ansible control node to automate a one-time task on one or more managed hosts. They are ideal for quick operations and troubleshooting that do not require the reusability and structured logic of a full Ansible playbook.

Eg (**Check connectivity - ansible all -m ping**)

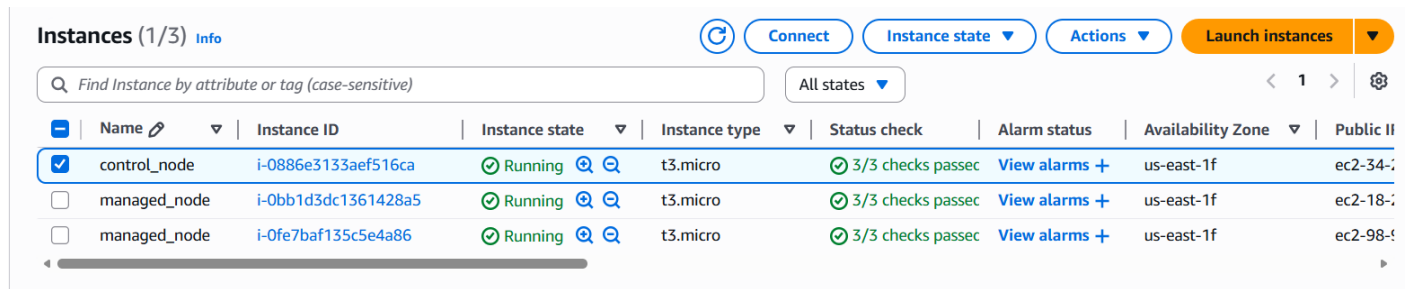

3. Pageant:

SSH authentication agent, securely holding your private keys in memory so you don't have to re-enter passphrases for every login, enabling seamless, passwordless access to servers. It runs in the system tray, loads your keys once (after you enter the passphrase), and then automatically provides those keys for authentication when PuTTY, [pscp](#), or [psftp](#) connect to servers.

Steps :

Create 3 instance 1.control_node 2.managed_node 3. managed_node

both instances download python3

The screenshot shows the AWS Management Console 'Instances' page. It lists three EC2 instances, all of which are in the 'Running' state. The first instance is named 'control_node' with ID 'i-0886e3133aef516ca'. The next two are both named 'managed_node' with IDs 'i-0bb1d3dc1361428a5' and 'i-0fe7baf135c5e4a86'. All instances are t3.micro type, located in us-east-1f, and have passed all status checks.

	Name	Instance ID	Instance state	Instance type	Status check	Alarm status	Availability Zone	Public IP
<input checked="" type="checkbox"/>	control_node	i-0886e3133aef516ca	Running	t3.micro	3/3 checks passed	View alarms +	us-east-1f	ec2-34-...
<input type="checkbox"/>	managed_node	i-0bb1d3dc1361428a5	Running	t3.micro	3/3 checks passed	View alarms +	us-east-1f	ec2-18-...
<input type="checkbox"/>	managed_node	i-0fe7baf135c5e4a86	Running	t3.micro	3/3 checks passed	View alarms +	us-east-1f	ec2-98-...

Install ansible in control_node only

```
[ec2-user@ip-172-31-66-217 ~]$ pip install ansible
Defaulting to user installation because normal site-packages is not writeable
